## I. INTRODUCTION

The M9 Armored Combat Earthmover (ACE) vehicle was developed as a versatile tractor that can bulldoze, rough grade, excavate, haul and winch. The vehicle will be used by divisional and Army corps combat engineers battalions to facilitate the movement of friendly forces and to impede the enemy. This multi-purpose construction tool is expected to significantly increase the combat construction potential of the engineers squad. Consideration is currently being directed toward an up-armored version of the M9 vehicle, although the basic M9 is protected with some aluminum armor. The M9 Project Manager has requested BRL to conduct a vulnerability analysis for both versions of the vehicle in order to determine the increased survivability of the up-armored M9 on the battlefield. These required vulnerability data are directly available as output from the vulnerable area (VAREA)<sup>1</sup> computer program. However, this program requires as input the M9 target descriptions as processed by the Geometric Information for Targets (GIFT)<sup>2,3</sup> computer code.

The first step is therefore the production of a geometric description of the vehicle of interest. Presently, the BRL uses the combinatorial geometry (COM-GEOM) technique for target description. The COM-GEOM technique uses logic-type operators to combine basic geometric solids to produce a three-dimensional computer model of the target. This COM-GEOM target description is used as input to the Geometric Information For Targets (GIFT) computer code.

Among other things, the GIFT code traces shotlines through a COM-GEOM description from any specified aspect, listing pertinent information about each component hit. These shotline data are then used as simulated penetrator paths through the target and are required as input for the VAREA program.

## II. M9 (ACE) BACKGROUND INFORMATION

The M9 vehicle, also known as the Universal Engineering Tractor (UET), was developed by Pacific Car and Foundry (PACCAR) of Renton, WA. The basic M9 vehicle is shown in Figure 1. The air-droppable vehicle is constructed of aluminum armor in a boxlike configuration. The front portion of the vehicle is an open bowl for carrying earth, cargo, or personnel while the rear half contains the power train components, the fuel tank, a winch and the operator station. The M9 is powered by a Cummins V-8 diesel which gives it a top speed of 30 MPH. Engineer squads are therefore afforded mobility equal to units which they accompany. The hydropneumatic suspension system is responsible for many of the versatile capabilities of the M9 tractor. The operator, by actuating a

set of levers which control oil flow in the suspension system, may raise either or both front corners of the vehicle. In this way either dozing or scraping can be readily accomplished. The scraper bowl may also be earth filled (ballasted) for greater traction in dozing aside from the above mentioned role of transport capability. The driver is afforded ballistic protection by the armored compartment and hatch which immediately surrounds him. In contrast, the up-armored M9 version, shown in Figure 2, is designed to be less vulnerable in the battlefield environment. This is largely accomplished through the use of add-on armor plates over certain portions of the standard M9 vehicle. Particular attention was directed toward protecting the relatively exposed engine and radiator assembly. A series of vertical and horizontal engine grills were added to the standard M9 vehicle. The grills were designed to permit appropriate air flow for radiator cooling. In addition, Kevlar (26 ply thick) was added to the interior walls of the driver compartment and certain other critical areas. Thin alloy steel plates were added to several exterior surfaces of the M9 vehicle. Detailed data concerning the exact nature of the modifications are available from the manufacturer. However these modifications have been incorporated into the COM-GEOM description of the up-armored M9. The COM-GEOM target description also includes all of the critical elements or sub-systems necessary for the operation of the M9 vehicle.

### III. COMBINATORIAL GEOMETRY BACKGROUND

The M9-ACE target description was developed in combinatorial geometry (COM-GEOM) as utilized by the Geometric Information For Targets (GIFT) computer code. The GIFT code is a geometry processing code which contains many validation and checking routines to assist the analyst in developing an error free COM-GEOM description.

Familiarization with the COM-GEOM technique and terminology is necessary for understanding any combinatorial geometry description. The following is a brief introduction to COM-GEOM, but a detailed explanation of this method and the requirements of the GIFT code can be found in References 2 and 3. Engineering drawings, manuals, photographs, or other illustrative material are required to produce a COM-GEOM description. This information is transformed into a geometric interpretation of the target using fifteen basic solids combined under three set theory operations. A complete COM-GEOM description contains a solid table, a region table, and a region identification table.

A solid is defined as one of the fifteen geometric figures available for use in COM-GEOM descriptions. A list of these solids appears in Table 1. The parameters of a solid give its location, size, and orientation within the coordinate system established for the target. These parameters, along with the solid type and an assigned solid number, are listed in sequence in the solid table.

A region is the space occupied by a single solid or a combination of solids. Solids are combined using any combination of three set operations: intersection (+), union (OR), and difference (-). The intersection of two solids is only the space in common to both solids, while union is the space occupied by either solid. The difference of two solids is defined as all the space of the first solid that is not contained in the second solid. Figure 3

| TRC           | Truncated Right Angle Cone  |
| TEC           | Truncated Elliptic Cone     |
| TGC           | Truncated General Cone      |

is the graphic representation of the three defined operations. Any number of the solids listed in the solid table can be used to determine a region. Each region is uniquely numbered, and its defining combination of solids is listed in the region table.

In the region identification table, each region is specified by either an item or space code number. These code numbers identify the region as a component of the target (an item) or as an air space in or around the target. Space not described as a region is assigned the air space code 01 by the GIFT code. Since it is not required to describe air inside a target, the 01 code can represent air both on the interior and exterior of a model. However, it is frequently useful to describe inside air regions, which leaves the 01 code designating outside air only. The RAYAIR subroutine of GIFT allows any region identified with a space code to overlap any region assigned an item code or the same space code. Regions with an item code or different space codes cannot overlap.

The region identification table also allows for up to 40 alphanumeric characters of descriptive data to be assigned to each region. Included in these 40 characters is a two-digit material code for all regions designated by item code. Following this material code is a percentage which indicates for the region the equivalent line-of-sight (LOS) thickness using the indicated material type. The material code and the LOS thickness are helpful to the vulnerability analyst using a COM-GEOM description. Table 2 lists the material codes and their assigned densities used in the description of the ACE system.

These three tables - solid, region, and region identification - comprise a complete COM-GEOM target description meeting all requirements for input to the GIFT computer code.

#### IV. COMBINATORIAL GEOMETRY DESCRIPTION OF THE (ACE) SYSTEM

The coordinate system used to describe the COM-GEOM description of the ACE vehicle was the same that was used in the manufacturer's blueprints. The positive X-axis is toward the front of the vehicle, the positive Y-axis is to the left, and the positive Z-axis is upward. Figure 4 depicts the coordinate system superimposed on a computer plot of the (ACE) system description. The unit of measure used in this description is the millimetre. Figures 4 through 10 are scaled computer plots of the COM-GEOM description of the (ACE) system.

The complete (ACE) system description consists of 367 solids and 367 regions, while the up-armored (ACE) consists of 416 solids and 416 regions. Both target descriptions are currently stored on magnetic tape and disc at the BRL.

Appendix A contains a complete listing of the standard ACE description. Table A-1 is a listing of the solids, Table A-2 is a listing of the regions, and Table A-3 is a listing of the region identification table.

Appendix B contains a complete listing of the up-armored ACE target description. Table B-1 is a listing of the solids, Table B-2 is a listing of

## V. VALIDATION PROCEDURE

One of the most important aspects of the target description process is the validation of the target description. This extensive procedure can entail nearly as much time as the actual describing of the target. The (ACE) system description has undergone the following thorough validation procedure.

The CHECK subroutine of the GIFT code pinpoints regions which overlap within a specified tolerance level. By definition, regions overlap when they occupy the same points in space. A tolerance level of 0.25 mm was used for the (ACE) system and any overlaps were corrected. •

A particularly difficult problem in the target description validation is the elimination of unwanted voids or undefined spaces. The GRID subroutine of the GIFT code is used to pinpoint this type of problem. GRID is the subroutine which traces shotlines completely through a description from any desired aspect; it lists the line-of-sight (LOS) thicknesses, the normal thicknesses, and the obliquity angles of every item encountered along each shotline. Among the many uses of this shotline information are locating voids in the target description and helping to eliminate them.

Another step in the validation process is the production and examination of computer plots of the target description for any misplaced regions. These plots are produced by the PICTUR subroutine of the GIFT code. Figures 4 through 10 are examples of the plots produced by PICTUR. Numerous plots of the (ACE) system description were carefully examined and any errors or misplaced regions were corrected.

USER EVALUATION SHEET/CHANGE OF ADDRESS

This Laboratory undertakes a continuing effort to improve the quality of the reports it publishes. Your comments/answers to the items/questions below will aid us in our efforts.

1. BRL Report Number \_\_\_\_\_ Date of Report \_\_\_\_\_
2. Date Report Received \_\_\_\_\_
3. Does this report satisfy a need? (Comment on purpose, related project, or other area of interest for which the report will be used.) \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_
4. How specifically, is the report being used? (Information source, design data, procedure, source of ideas, etc.) \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_
5. Has the information in this report led to any quantitative savings as far as man-hours or dollars saved, operating costs avoided or efficiencies achieved, etc? If so, please elaborate. \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_
6. General Comments. What do you think should be changed to improve future reports? (Indicate changes to organization, technical content, format, etc.) \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_
